Boost your performance and confidence with these topic-based exam questions

Practice questions created by actual examiners and assessment experts

Detailed mark schemes
Suitable for all boards
Designed to test your ability and thoroughly prepare you

### 17.1 The Equilibrium Law

|B Chemistry - Revision Notes
www.exampaperspractice.co.uk

### 17.1.1 Applying the Equilibrium Law

## Explaining Le Châtelier's Principle

## Le Châtelier's principle

- Le Châtelier's principle says that if a change is made to a system at dynamic equilibrium, the position of the equilibrium moves to minimise this change
- The principle can be used to predict changes to the position of equilibrium when there are changes in temperature, pressure orconcentration

## Explaining Le Châtelier's Principle

- The equilibrium law can explain and quantify the effect of changes in concentration at a particular temperature
- These explanations are based on the idea that $K_{c}$ is not affected by a change in concentration
- Remember that the position of equilibrium is affected by a change in concentration:

## Effects of ConcentrationTable

| CHANGE | HOW THE EQUILIBRIUM SHIFTS |
| :--- | :--- |
| INCREASE IN <br> CONCENTRATION | EQUILIBRIUM SHIFTS TO THE RIGHT TO REDUCE THE <br> EFFECT OF INCREASE IN THE CONCENTRATION OF A <br> REACTANT |
| DECREASE IN <br> CONCENTRATION <br> Exam Papers Practice | EQUILIBRIUM SHIFTS TO THE LEFT TO REDUCE THE EFFECT <br> OF A DECREASE IN REACTANT (OR AN INCREASE IN THE <br> CONCENTRATION OF PRODUCT) |

- $K_{c}$ for a general reaction such $\mathbf{a A}+\mathrm{bB} \rightleftharpoons \mathrm{c} \mathrm{C}+\mathrm{dD}$ is:

$$
K_{c}=\frac{[C]^{c}[D]^{d}}{[A]^{a}[B]^{b}}
$$

[A] AND [B] = EQUILIBRIUM REACTANT CONCENTRATIONS (mol dm ${ }^{-3}$ )
[C] AND [D] = EQUILIBRIUM PRODUCT CONCENTRATIONS (mol dm³)
$a, b, c$ AND $d=$ NUMBER OF MOLES OF REACTANTS AND PRODUCTS

## Equilibrium expression linking the equilibrium concentration of reactants and products at equilibrium

- If the concentration of Aincreases
- The position of equilibrium shifts to the right as the forward reactionworks to remove excess A
- The concentrations of C and Dincrease to minimise this change
- The concentration of $B$ decreases because it is being used up to minimise the change
- Therefore, the value of $K_{c}$ remains unchanged
- If the concentration of Adecreases
- The position of equilibrium shifts to the left as the backward reaction works to replace A
- The concentrations of C and Ddecrease to minimise this change
- The concentration of $B$ increases because it is also being pro duced when $C$ and $D$ react
- Therefore, the value of $K_{c}$ remains unchanged
- The HaberProcess is represented bythe following chemical equation:

$$
\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g}) \rightleftharpoons 2 \mathrm{NH}_{3}(\mathrm{~g})
$$

- An increase in the amo unt of nitro gen will cause the following:
- The equilibrium to shift to the right
- An increase in the amount of ammonia
- Adecrease in the amount of hydrogen
- $K_{c}$ will remain unchanged

Exan papright
© 2024 Exam Papers Practice

Graph showing the effects of adding nitrogen on the concentration of reactants and products in the HaberProcess

- An increase in the amo unt of nitrogencauses the rate of the forward reaction to increase
- This means that more ammonia is produced, causing the rate of the backward reaction to increase
- This process of increasing forward and backward reactions continues until a new equilibrium is established
- The rate at this newly established equilibrium will be higher than the original rate

Graph showing the effects of adding nitrogen on the rate of reaction in the Haber Process

- Similar points about concentrations and rates can be made forthe addition of hydrogen or the removal of ammonia
- Regardless, the value of $K_{c}$ remains unchanged
- Only changes in temperature affect $K_{c}$

## Equilibrium Problems

## Calculations involving $K_{c}$

- In the equilibrium expression, each terminside a square bracket represents the concentration of that chemical in $\mathrm{moldm} \mathrm{m}^{-3}$
- Therefore, the units of $K_{c}$ depend on the equilibrium expression
- Some questions give the number of moles of each of the reactants and products at equilibrium to gether with the volume of the reaction mixture
- The concentrations of the reactants and products can then be calculated from the number of moles and total volume

## Worked example

## Calculating $K_{c}$ of ethano ic acid

Ethano ic acid and ethanol react to form the ester ethyl ethano ate and water as follows:

$$
\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{I})+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{I}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}(\mathrm{I})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})
$$

At equilibrium, $500 \mathrm{~cm}^{3}$ of the reaction mixture contained 0.235 mol of ethano ic acid and 0.035 mol of ethanol to gether with 0.182 mol of ethyl ethano ate and 0.182 mol of water.

Use this data to calculate a value of $K_{c}$ for this reaction.

Answer:
Step 1: Calculate the concentrations of the reactants and products:

| $\left[\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{I})\right]$ | $=\frac{0.235}{0.500}$ | $=0.470 \mathrm{~mol} \mathrm{dm}^{-3}$ |
| :--- | :--- | :--- |
| $\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{I})\right]$ | $=\frac{0.035}{0.500}$ | $=0.070 \mathrm{~mol} \mathrm{dm}^{-3}$ |
| $\left[\mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}(\mathrm{I})\right]$ | $=\frac{0.182}{0.500}$ | $=0.364 \mathrm{~mol} \mathrm{dm}^{-3}$ |
| $\left[\mathrm{H}_{2} \mathrm{O}(\mathrm{I})\right]$ | $=\underline{0.182}$ | $=0.364 \mathrm{~mol} \mathrm{dm}^{-3}$ |

"

Step 2: Write out the balanced symbol equation with the concentrations of each chemical underneath:

$$
4
$$

Step 3: Write out the equilibrium constant for the reaction:

$$
K_{c}=\frac{\left[\mathrm{H}_{2} \mathrm{O}\right]\left[\mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}\right]}{\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right]\left[\mathrm{CH}_{3} \mathrm{COOH}\right]}
$$

Step 4: Substitute the equilibrium concentrations into the expression and calculate the answer:

$$
K_{c}=\frac{(0.364) x(0.364)}{(0.070) x(0.470)}
$$

© 2024 Exam Papers Practice

$$
=4.03
$$

Step 5: Deduce the correct units for $K_{c}$ :

$$
K_{c}=\frac{\left(\mathrm{mol} \mathrm{dm}^{-3}\right) \times\left(\mathrm{mol} \mathrm{dm}^{-3}\right)}{\left(\mathrm{mol} \mathrm{dm}^{-3}\right) \times\left(\mathrm{mol} \mathrm{dm}^{-3}\right)}
$$

- All units cancel out
- Therefore, $K_{c}=4.03$
- Note that the smallest number of significant figures used in the question is 3 , so the final answer should also be given to 3 significant figures
- Some questions give the initial and equilibrium concentrations of the reactants but not the products
- An initial, change and equilibrium (ICE) table should be used to determine the equilibrium concentration of the products using the molar ratio of reactants and products in the stoichiometric equation

## Worked example

## Calculating $K_{c}$ of ethyl ethano ate

Ethyl ethano ate is hydrolysed bywater:

## $\mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}(\mathrm{I})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COOH}(\mathrm{I})+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{I})$

0.1000 mol of ethyl ethano ate are ad ded to 0.1000 mol of water. Alittle acid catalyst is ad ded and the mixture made up to $1 \mathrm{dm}^{3}$. At equilibrium 0.0654 mol of water are present. Use this data to calculate a value of $K_{c}$ for this reaction.

## Answer:

Step 1: Write out the balanced chemical equation with the concentrations of beneath each substance using an initial, change and equilibrium table:

| $\mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}(\mathrm{~L})+\mathrm{H}_{2} \mathrm{O}(\mathrm{L}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COOH}(\mathrm{L})+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{L})$ |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Copyright <br> © 2024 Exam Pa <br> Initial moles | 0.1000 | 0.1000 | 0 | 0 |
| ChangeChice | -0.0346 | -0.0346 | +0.0346 | +0.0346 |
| Equilibrium <br> moles | 0.0654 | 0.0654 | 0.0346 | 0.0346 |

Step 2: Calculate the concentrations of the reactants and products:

| $\left[\mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}(\mathrm{I})\right]$ | $=\frac{0.0654}{1.000}$ | $=0.0654 \mathrm{~mol} \mathrm{dm}^{-3}$ |
| :--- | :--- | :--- |
| $\left[\mathrm{H}_{2} \mathrm{O}(\mathrm{I})\right]$ | $=\frac{0.0654}{1.000}$ | $=0.0654 \mathrm{~mol} \mathrm{dm}^{-3}$ |
| $\left[\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{I})\right]$ | $=\frac{0.0346}{1.000}$ | $=0.0346 \mathrm{~mol} \mathrm{dm}^{-3}$ |
| $\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{I})\right]$ | $=\frac{0.0346}{1.000}$ | $=0.0346 \mathrm{~mol} \mathrm{dm}^{-3}$ |

Step 3: Write the equilibrium constant for this reaction in terms of concentration:

$$
K_{c}=\frac{\left.\left[\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right]\left[\mathrm{CH}_{3} \mathrm{COOH}\right]\right]}{\left[\mathrm{H}_{2} \mathrm{O}\right]\left[\mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}\right]}
$$

Step 4: Substitute the equilibrium concentrations into the expression:

$$
\begin{gathered}
K_{c}=\frac{(0.0346) x(0.0346)}{(0.0654) x(0.0654)} \\
=0.28
\end{gathered}
$$

Step 5: Deduce the correct units for $K_{c}$ :

$$
\left.K_{c}=\frac{(\mathrm{mol} \mathrm{dm}}{}{ }^{-3}\right) x\left(\mathrm{~mol} \mathrm{dm}^{-3}\right),\left(\mathrm{mol} \mathrm{dm}^{-3}\right) x\left(\mathrm{~mol} \mathrm{dm}^{-3}\right),
$$

- Allunits cancelout
- Therefore, $K_{c}=0.28$

### 17.1.2 Gibbs Free Energy \& the Equillbrium Constant

## Gibbs Free Energy \& the Equilibrium Constant

## Gibbs Free Energy \& the Equilibrium Constant

- The equilibrium constant, $K_{c}$, gives no information about the individual rates of reaction
- It is independent of the kinetics of the reaction
- The equilibrium constant, $K_{C}$, is directly related to the Gibbs free energy change, $\Delta G^{\equiv}$, according to the following (van't Hoff's) equation:

$$
\Delta G^{\equiv}=-R T \ln K
$$

- $\Delta G^{\equiv}=$ Gibbs free energy change ( $\mathrm{kJ} \mathrm{mol}^{-1}$ )
- $R=$ gas constant $\left(8.31 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right)$
- $T$ =temperature (Kelvin, K)
- K=equilibrium constant
- This equation is provided insection lof the data booklet

## - Exam Tip

When completing calculations using the $\Delta G^{\equiv}=-R T \ln K$ equation, you have to be aware that:

- $\Delta G^{\equiv}$ is measure in $\mathbf{k J ~ m o l}{ }^{-1}$
- $R$ is measured in $\mathrm{JK}^{-1} \mathrm{~mol}^{-1}$

This means that one of these values will need adjusting by a factor of 1000

- This relationship between the equilibrium constant, $K_{c}$, and Gibbs free energy change, $\Delta G^{\equiv}$, can be used to determine whether the forward or backward reaction is favoured

| Equilibrium <br> constant, $\kappa$ | Description | Gibbs free <br> energy change, $\Delta G$ |
| :---: | :--- | :--- |
| $\kappa>1$ | Products favoured | $\Delta G<0 \quad$ (negative) |
| $\kappa=1$ | Reaction at equilibrium <br> Neither reactants nor <br> products are favoured | $\Delta G=0$ |
| $\kappa<1$ | Reactants tavoured | $\Delta G>0 \quad$ (positive) |

The relationship between the equilibrium constant, $K_{c}$, and Gibbs free energy change, $\Delta \mathbf{G}^{\equiv}$

- At a given temperature, a negative $\Delta G$ value for a reaction indicates that:
- The reaction is feasible / spontaneous
- The equilibrium concentration of the products is greater than the equilibrium concentration of the reactants
- The value of the equilibrium constant is greaterthan 1
- As $\Delta$ Gbecomes more negative:
- The forward reaction is favo ured more
- The value of the equilibrium constant increases

Page 10 of 12

## Free Energy \& Equilibrium Calculations

- The relationship between Gibbs free energy change, $\Delta G^{\equiv}$, temperature and the equilibrium constant, $K_{\mathrm{c}}$, is described by the equation:

$$
\Delta G^{\equiv}=-R T \ln K
$$

- The rearrangement of this equation makes it possible to:
- Calculate the equilibrium constant
- Deduce the position of equilibrium for the reaction

$$
\ln K=-\frac{\Delta G}{R T}
$$

## Worked example

Calculating $K_{\mathbf{c}}$ Ethanoic acid and ethanol react to form the ester ethyl ethano ate and water as follows:

$$
\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{I})+\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(\mathrm{I}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COOC}_{2} \mathrm{H}_{5}(\mathrm{I})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})
$$

At $25^{\circ} \mathrm{C}$, the free energy change, $\Delta G^{\equiv}$, for the reaction is $-4.38 \mathrm{~kJ} \mathrm{~mol}^{-1} .\left(R=8.31 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}\right)$

1. Calculate the value of $K_{c}$ for this reaction
2. Using your answer to part (1), predict and explain the position of the equilibrium

Answers
Answer 1:
Step 1: Convert any necessary values

- $\Delta G^{\bar{\equiv}}$ into $\mathrm{Jmol}^{-1}$.
- $-4.38 \times 1000=-4380 \mathrm{~J} \mathrm{~mol}^{-1}$
- Tinto Kelvin
- $25+273=298 \mathrm{~K}$

Step 2: Write the equation:

- $\Delta G^{\equiv}=-R T \ln K_{c}$

Step 3: Substitute the values:

- $-4380=-8.31 \times 298 \times \ln K_{C}$

Step 4: Rearrange and solve the equation for $K_{c}$ :

- $\ln K_{c}=-4380 \div(-8.31 \times 298)$
- $\ln K_{C}=1.77$
- $K_{c}=e^{1.77}$
- $K_{C}=5.87$

Answer 2:
From part (1), the value of $K_{c}$ is 5.87
Therefore, the equilibrium lies to the right / products side because the value of $K_{c}$ is po sitive
