

## **Studying cells 1**

Level: AQA AS 7401

Subject: Biology

Exam Board: Suitable for all boards

Topic: Studying cells 1

Type: Questionnaire

To be used by all students preparing for AQA AS Biology 7401 foundation or higher tier but also suitable for students of other boards.

The diagram shows a cholera bacterium. It has been magnified 50 000 times.

•	
canning e	cteria can be viewed using a transmission electron microscope (TEM) or a lectron microscope (SEM).
) Give	one advantage of using a TEM rather than a SEM.
i) Give	one advantage of using a SEM rather than a TEM.

(d) Calculate the actual width of the cholera bacterium between points **B** and **C**. Give your answer in micrometres and show your working.

(2)

(e) An outbreak of cholera occurred in London in 1849. The graph shows the relationship between the number of deaths from cholera and the height at which people lived above sea level.

(a) Name the type of bond that joins amino acids together in a polypeptide.

(1)

The diagram shows a cell from the pancreas.

A student investigated mitosis in the tissue from an onion root tip.

(a)	The student prepared a temporary mount of the onion tissue on a glass slide. She covered
	the tissue with a cover slip. She was then given the following instruction.

"Push down hard on the cover slip, but do not push the cover slip sideways."

Explain why she was given this instruction.

The image below shows one cell the student saw in the onion tissue.

© Ed Reschke/ Oxford Scientific/Getty Images

(b)	The student concluded that the cell in the image above was in the anaphase stage o
	mitosis.

Was she correct? Give two reasons for your answer.

1	 	 	 
2	 	 	 

(2)

(2)

(c)	The student counted the number of cells she observed in each stage of mitosis.  Of the 200 cells she counted, only six were in anaphase.
	One cell cycle of onion root tissue takes 16 hours. Calculate how many minutes these cells spend in anaphase.
	Show your working.
	Answer = minutes

(4)

(b) A student cut thin sections of tissue at different distances from the tip of a root. She stained the sections and viewed them with an optical microscope.

For each section, the student counted the number of cells in mitosis and the total number of cells in each field of view. She then calculated a **mitotic index** for each section using the equation:

The student's results arer shown in the graph.

(i) The student cut thin sections of tissue to view with an optical microscope. Explain why it was important that the sections were thin.

(2)

What does the graph show about the growth of roots? Use the data to explain your answer.

(2)

(Total 8 marks)

A stomach ulcer is caused by damage to the cells of the stomach lining. People with stomach ulcers often have the bacterium *Helicobacter pylori* in their stomachs.

A group of scientists was interested in trying to determine how infection by *H. pylori* results in the formation of stomach ulcers.

The scientists grew different strains of *H. pylori* in liquid culture.

The table below shows the substances released by each of these strains.

H nylovi otvojn	Substances r	eleased by the <i>H. pylori</i> cells
<i>H. pylori</i> strain	Toxin	Enzyme that neutralises acid
А	✓	✓
В	*	✓
С	✓	×

The scientists centrifuged the cultures of each strain to obtain cell-free liquids. They added each liquid to a culture of human cells. They then recorded the amount of damage to the human cells.

Their results are shown below. The error bars show  $\pm$  1 standard deviation.

(a)

of capillaries per fibre reliable.

Researchers investigated whether the blood supply to slow and fast muscle fibres in a muscle changes with age. They used diaphragms taken from hamsters (*Mesocricetus auratus*). The diaphragm is in constant use for breathing. They took diaphragms from groups of young, adult and old hamsters.

They removed the diaphragm from each animal and took a sample of muscle tissue. They examined it under an optical (light) microscope. For each sample they selected several fields of view at random. In each field of view, they then counted the number of capillaries associated with each type of muscle fibre.

This allowed the researchers to calculate the mean number of capillaries for each type of muscle fibre, for each age group.

The table below shows the researchers' results which include standard deviation (SD).

Hamster	Number of hamsters in		pillaries associated of muscle fibre
age group	group	Slow fibres (± SD)	Fast fibres (± SD)
Young	9	3.4 (±0.8)	4.0 (±0.8)
Adult	10	4.7 (±0.2)	6.3 (±0.4)
Old	8	4.6 (±0.9)	6.8 (±0.6)
